MOTION DETECTOR

SMART MOVE

Completely wireless thanks to
power-generating solar panel

DISCOVER THE WIRELESS SMART MOVE

The SMART MOVE is a completely wireless motion detector. It is equipped with a solar panel that stores the energy collected internally. Since the SMART MOVE has its own light sensor, it only works after dark. Thanks to Bluetooth connectivity, it is possible to install up to 16 SMART MOVE motion detectors in a yard.

Once connected to the SMART HUB-150, the detectors are configured in a 'mesh network', which creates a closed system in the yard. The SMART MOVE is not fully charged when supplied. This means it must be charged in direct sunlight (for around three hours) before installing! The most recent version of the in-lite app (for iOS and Android) should then be downloaded and the installation instructions followed.

- Easy to operate using the in-lite app for iOS and Android smartphones & tablets.
- Can easily be installed dozens of meters from the transformer.
- Motion detection up to 10 meters guaranteed.
- Up to 16 SMART MOVE motion detectors can be connected to one SMART HUB-150.
